Mission:

To protect, promote & improve the health of all people in Florida through integrated state, county & community efforts.

Rick Scott Governor

John H. Armstrong, MD, FACS

State Surgeon General & Secretary

Vision: To be the Healthiest State in the Nation

Dear Parents:

As children approach adolescence, there are steps you can take to protect them from vaccine-preventable diseases. The more you know about the importance of immunization, the more you can help to protect your teen from serious diseases like meningitis.

Meningococcal disease (meningococcal meningitis or meningococcal septicemia), are bacterial infections that pose a rare but serious threat to adolescents. Here are some key things you and your teen should know:

- Meningococcal disease is caused by bacteria that infect the bloodstream and linings of both the brain and spinal cord, and can cause serious illness if left untreated.
- Following childhood, rates for meningococcal disease rise again in early adolescence, peaking between the ages of 15 and 24 years.
- Although rare, meningococcal disease is particularly dangerous because it progresses so rapidly and can be fatal within hours.
- According to a recent study and government data, for people who get infected the risk of death from meningococcal disease is up to 5 times higher among 15-24 year olds, compared with younger populations.
- Up to 1 in 5 survivors of meningococcal disease will suffer from lifelong complications, including loss of limbs, hearing damage, and other neurological damage.

Meningococcal disease develops quickly - vaccination is recommended

In situations of close personal contact, bacteria that cause meningococcal disease can be spread through sneezing or coughing, as well as through direct contact with an infected person (such as kissing or sharing a drinking glass). The disease often begins with symptoms that can be easily mistaken for common illnesses, such as influenza. Teens should be warned to seek immediate medical attention if they develop sudden onset of fever, headache, stiff neck, rash, nausea, vomiting, light sensitivity, or altered mental status.

- To protect young people against meningococcal disease, the meningococcal conjugate vaccine is recommended for all 11 - 18 year olds. Children should get this vaccine at 11 - 12 years of age and a booster dose at age 16.
- It is also recommended for college freshmen living in dormitories, if not previously vaccinated

The Florida Department of Health in Pasco County is committed to promoting and protecting the health of our community. For more information you may visit http://www.floridahealth.gov/diseases-and-conditions/vaccine-preventable-disease/meningitis/index.html – contact your medical provider or call our Immunization office at 727-861-5260.

Sincerely,

Michael J. Napier, MS // Administrator, Health Officer
